1.13 Built in conversion methods

Tip: Unless you are trying to register a custom coordinate operation, you do not need to worry about these, they are very much in the realm of implementation detail. For normal use, refer to *Coordinate Conversions*.

Note: If you are interested in the full details (including formulas) for any particular method, please see the EPSG guidance notes

1.13.1 Abridged Molodensky

```

1.14 Custom coordinate systems

Note: In ISO 19111 terminology, what most people refer to as a *Coordinate System* is actually called a *Coordinate Reference System* (or *CRS* for short), with the term *Coordinate System* being used to refer to the *axes used*. PHPCoord's actual code uses the ISO naming system.

To make use of a custom CRS, all you need to do is register it. Once registered, your custom system can be used exactly like any other built into PHPCoord. To register, call the appropriate registration function:

```
PHPCoord\CoordinateReferenceSystem\Geocentric::registerCustomCRS(
    string $srid,
    string $name,
    string $coordinateSystemSrid,
    string $datumSrid,
    BoundingArea $extent
);

PHPCoord\CoordinateReferenceSystem\Geographic2D::registerCustomCRS(
    string $srid,
    string $name,
    string $coordinateSystemSrid,
    string $datumSrid,
    BoundingArea $extent,
    ?string $baseCRS
```

(continues on next page)

(continued from previous page)

```
);

PHPCoord\CoordinateReferenceSystem\Geographic3D::registerCustomCRS(
    string $srid,
    string $name,
    string $coordinateSystemSrid,
    string $datumSrid,
    BoundingArea $extent,
    ?string $baseCRS
);

PHPCoord\CoordinateReferenceSystem\Projected::registerCustomCRS(
    string $srid,
    string $name,
    string $baseCRS,
    string $derivingConversionSrid,
    string $coordinateSystemSrid,
    BoundingArea $extent
);

PHPCoord\CoordinateReferenceSystem\Vertical::registerCustomCRS(
    string $srid,
    string $name,
    string $coordinateSystemSrid,
    string $datumSrid,
    BoundingArea $extent
);
```

For example

```
<?php
namespace YourApp\Geo;
use PHPCoord\CoordinateSystem\Geographic;
use PHPCoord\CoordinateReferenceSystem\Geographic2D;
use PHPCoord\Datum\Datum;
use PHPCoord\Geometry\BoundingArea;
use PHPCoord\Geometry\RegionMap;

$boundingArea = BoundingArea::createFromArray(
    [
        [
            [
                [93.41, -60.55], [93.41, -8.47], [173.34, -8.47], [173.34, -60.55], [93.
↪41, -60.55]
            ]
        ]
    ]
    RegionMap::REGION_OCEANIA
);

Geographic2D::registerCustomCRS(
    'urn:yourcompany:geo:crs:GDA2020-lon-lat',
```

(continues on next page)

(continued from previous page)

```
    'GDA2020 (in lon-lat order)',
    Ellipsoidal::fromSRID(
        Ellipsoidal::EPSG_2D_AXES_LONGITUDE_LATITUDE_ORIENTATIONS_EAST_NORTH_UOM_DEGREE
    ),
    Datum::fromSRID(
        Datum::EPSG_GEOCENTRIC_DATUM_OF_AUSTRALIA_2020
    ),
    $boundingArea
);
```

Note: If defining a custom projected CRS, you must specify the SRID of the conversion to/from the base CRS. Although you *can* specify the SRID of a built-in conversion, please note that unlike CRSs, the set of conversions built in to PHPCoord is considered an implementation detail and although stable in practice, stability is not guaranteed. Consider duplicating the one you need and registering it as a custom operation to avoid this risk.

Tip: A SRID (spatial reference identifier), is a just a unique string that can be used to identify the specific CRS or other geospatial type in question. The PHPCoord built-in systems all use an URN for this purpose, but you can use anything you like as long as it is unique.

1.15 Custom conversions

Note: In ISO 19111 terminology, when converting points between one CRS and another, a distinction is drawn between a conversion and a transformation. PHPCoord uses the words interchangeably.

In addition to simply *invoking a particular coordinate conversion method with the parameters of your choice*, PHPCoord also supports registering a custom conversion so that you can *use easy mode* thereafter.

Adding a custom coordinate transformation to PHPCoord is a 2-step process. Step 1 is to register the *coordinate operation* within the system. A coordinate operation is the combination of the conversion method (e.g. Transverse Mercator or Molodensky-Badekas, together any parameters that particular formula requires). Step 2 is to register that particular coordinate operation as a way to transform 1 CRS to another.

The reason for the 2-step process is because the same method/parameters are often used across multiple different CRS pairs - e.g. the projection method and params for any particular US State Plane conversion remain constant across NAD83 revisions. Keeping this conceptual separation even for custom conversions helps to keep PHPCoord internals clean.

```
// step 1, register an operation

PHPCoord\CoordinateOperation\CoordinateOperations::registerCustomOperation(
    string $srid,
    string $name,
    string $methodSrid,
    BoundingArea $extent,
    array $params
);
```

(continues on next page)

(continued from previous page)

```
// step 2, register that operation as a way to convert between 2 CRSs

PHPCoord\CoordinateOperation\CoordinateOperations::registerCustomTransformation(
    string $operationSrid,
    string $name,
    string $sourceCRSSrid,
    string $targetCRSSrid,
    float $accuracy // in metres, used by easy-mode conversion to pick the most accurate␣
↪option available
);
```

For example, to construct a conversion to a hypothetical GDA2020 with Sydney Opera House as the prime meridian rather than Greenwich:

```
<?php
namespace YourApp\Geo;
use PHPCoord\CoordinateOperation\CoordinateOperationMethods;
use PHPCoord\CoordinateOperation\CoordinateOperations;
use PHPCoord\CoordinateReferenceSystem\Geographic2D;
use PHPCoord\Geometry\BoundingArea;
use PHPCoord\Geometry\RegionMap;

// step 1, register an operation
$boundingArea = BoundingArea::createFromArray(
    [
        [
            [
                [93.41, -60.55], [93.41, -8.47], [173.34, -8.47], [173.34, -60.55], [93.
↪41, -60.55]
            ]
        ]
    ]
    RegionMap::REGION_OCEANIA
);

CoordinateOperations::registerCustomOperation(
    'urn:yourcompany:geo:coordinateOperation:GDA2020-greenwich-sydney',
    'GDA2020 (Greenwich) to GDA2020 (Sydney)',
    CoordinateOperationMethods::EPSG_LONGITUDE_ROTATION,
    $boundingArea,
    [
        'longitudeOffset' => new Degree(-151.214167),
    ]
);

// step 2, register that operation as a way to convert between 2 CRSs
CoordinateOperations::registerCustomTransformation(
    'urn:yourcompany:geo:coordinateOperation:GDA2020-greenwich-sydney',
    'GDA2020 (Greenwich) to GDA2020 (Sydney)',
    Geographic2D::fromSRID(Geographic2D::EPSG_GDA2020),
    'urn:yourcompany:geo:crs:GDA2020-sydney',
    0.0
```

(continues on next page)

(continued from previous page)

```
);

// step 3, use it
$from = GeographicPoint::create(
    Geographic2D::fromSRID(Geographic2D::EPSG_GDA2020),
    new Degree(-33.858611),
    new Degree(151.214167)
);
$to = $from->convert(
    Geographic2D::fromSRID('urn:yourcompany:geo:crs:GDA2020-sydney')
);

$latitude = $point->getLatitude(); // -33.858611
$longitude = $point->getLongitude(); // 0.0
```

Tip: A SRID (spatial reference identifier), is a just a unique string that can be used to identify the specific CRS or other geospatial type in question. The PHPCoord built-in systems all use an URN for this purpose, but you can use anything you like as long as it is unique.

1.16 Custom datums

To make use of a custom datum, all you need to do is register it. Once registered, your custom datum can be used exactly like any other built into PHPCoord. To register, call:

`PHPCoord\Datum\Datum::registerCustomDatum(string $srid, string $name, string $type, ?string $ellipsoidSrid, ?string $primeMeridianSrid, ?DateTimeInterface $frameReferenceEpoch)`

where `$type` is one of `Datum::DATUM_TYPE_GEODETIC`, `Datum::DATUM_TYPE_DYNAMIC_GEODETIC`, or `Datum::DATUM_TYPE_VERTICAL`

```
<?php
namespace YourApp\Geo;
use PHPCoord\Datum\Datum;
use PHPCoord\Datum\Ellipsoid;
use PHPCoord\Datum\PrimeMeridian;

Datum::registerCustomDatum(
    'urn:yourcompany:geo:datum:WGS84-Athens',
    'WGS 84 (Athens)',
    Datum::DATUM_TYPE_GEODETIC,
    Ellipsoid::EPSG_WGS_84,
    PrimeMeridian::EPSG_ATHENS
);
$datum = Datum::fromSRID('urn:yourcompany:geo:datum:WGS84-Athens');
```

Tip: A SRID (spatial reference identifier), is a just a unique string that can be used to identify the specific datum or other geospatial type in question. The PHPCoord built-in datums all use an URN for this purpose, but you can use

anything you like as long as it is unique.

1.17 Custom ellipsoids

To make use of a custom ellipsoid, all you need to do is register it. Once registered, your custom ellipsoid can be used exactly like any other built into PHPCoord. To register, call:

`PHPCoord\Datum\Ellipsoid::registerCustomEllipsoid(string $srid, string $name, Length $semiMajorAxis, Length $semiMinorAxis)`

```php
<?php
namespace YourApp\Geo;
use PHPCoord\UnitOfMeasure\Length\Metre;
use PHPCoord\Datum\Ellipsoid;

$semiMajorAxis = new Metre(6378137.0); // any Length unit is acceptable
$semiMinorAxis = new Metre(6356752.314); // any Length unit is acceptable

/*
 * Some ellipsoids are defined by a semi-major axis and their flattening, rather than by a combination
 * of a semi-major and semi-minor axis. If this is your situation, you will need to calculate the
 * semi-minor axis yourself, this can be done via the formula below.
 */
$semiMinorAxis = $semiMajorAxis - ($semiMajorAxis / $inverseFlattening);

Ellipsoid::registerCustomEllipsoid('urn:yourcompany:geo:datum:FOO123', 'FOO-123', $semiMajorAxis, $semiMinorAxis);
$ellipsoid = Ellipsoid::fromSRID('urn:yourcompany:geo:datum:FOO123');
```

Tip: A SRID (spatial reference identifier), is a just a unique string that can be used to identify the specific ellipsoid in question. The PHPCoord built-in ellipsoids all use an URN for this purpose, but you can use anything you like as long as it is unique.

1.18 Custom prime meridians

To make use of a custom prime meridian, all you need to do is register it. Once registered, your custom meridian can be used exactly like any other built into PHPCoord. To register, call:

`PHPCoord\Datum\PrimeMeridian::registerCustomMeridian(string $srid, string $name, Angle $longitudeFromGreenwich)`

```php
<?php
namespace YourApp\Geo;
use PHPCoord\UnitOfMeasure\Angle\Degree;
use PHPCoord\Datum\PrimeMeridian;
```

(continues on next page)

(continued from previous page)

```
$longitudeFromGreenwich = new Degree(-6.260278); // any Angle unit is acceptable

PrimeMeridian::registerCustomMeridian('urn:yourcompany:geo:datum:dublin', 'Dublin',
↪$longitudeFromGreenwich);

$meridian = PrimeMeridian::fromSRID('urn:yourcompany:geo:datum:dublin');
```

Tip: A SRID (spatial reference identifier), is a just a unique string that can be used to identify the specific meridian in question. The PHPCoord built-in meridians all use an URN for this purpose, but you can use anything you like as long as it is unique.

1.19 Custom units of measure

Coordinates have many different types of unit e.g. latitudes are angles, but eastings are lengths.

There are also many different units in use across the world and across history, for instance most current mapping uses the metre for lengths, but older mapping often used feet or yards.

To avoid confusion about what any given number is intended to represent, all units in PHPCoord are typed as value objects.

In addition to the many built-in units, you can also register and make use of custom units. To do this, first create an implementation class for your unit that extends one of the following base classes:

- `PHPCoord\UnitOfMeasure\Angle\Angle`
- `PHPCoord\UnitOfMeasure\Length\Length`
- `PHPCoord\UnitOfMeasure\Scale\Scale`
- `PHPCoord\UnitOfMeasure\Time\Time`

Tip: You only have to implement 4 required methods. All `UnitOfMeasure` require implementations of `__construct()`, `getUnitName()` and `getValue()`. There is then 1 additional method that is specific to each type of unit, e.g. a custom `Angle` type would be required to implement an `asRadians()` method. Your IDE will guide you through what is required, although of course you may reference the existing units as a guide.

Then register it, by calling the appropriate registration function:

```
PHPCoord\UnitOfMeasure\Angle\Angle::registerCustomUnit(
    string $srid,
    string $name,
    string $implementingClassFQCN
);

PHPCoord\UnitOfMeasure\Length\Length::registerCustomUnit(
    string $srid,
    string $name,
    string $implementingClassFQCN
);
```

(continues on next page)

(continued from previous page)

```
PHPCoord\UnitOfMeasure\Scale\Scale::registerCustomUnit(
    string $srid,
    string $name,
    string $implementingClassFQCN
);

PHPCoord\UnitOfMeasure\Time\Time::registerCustomUnit(
    string $srid,
    string $name,
    string $implementingClassFQCN
);
```

Once registered, your custom unit can be used exactly like any other built into PHPCoord.

Tip: A SRID (spatial reference identifier), is a just a unique string that can be used to identify the specific unit in question. The PHPCoord built-in units all use an URN for this purpose, but you can use anything you like as long as it is unique. For a unit, this might include reusing the FQCN.

For example, a custom `HalfKilometre` unit, could be implemented like this:

```php
<?php
namespace YourApp\Geo\Units;

use PHPCoord\UnitOfMeasure\Length\Length;

class HalfKilometre extends Length {

    public const SRID = 'urn:yourcompany:geo:uom:halfkm';

    private float $length;

    public function __construct(float $length)
    {
        $this->length = $length;
    }

    public function asMetres(): Metre
    {
        return new Metre($this->length * 500);
    }

    public function getValue(): float
    {
        return $this->length;
    }

    public function getUnitName(): string
    {
        return 'Half-kilometre';
    }
}
```

(continues on next page)

(continued from previous page)

```
Length::registerCustomUnit(HalfKilometre::SRID, 'Half-kilometre', HalfKilometre::class);

$value = new HalfKilometre(123);
// or
$value = Angle::makeUnit(123, HalfKilometre::SRID);
```

1.20 Changelog

1.20.1 Unreleased

Changed

- Updates to data for Czechia, Denmark, ETRS89, Portugal and St Helena
- Minimum PHP version increased to 8.1

1.20.2 5.8.0 - 2024-02-03

Added

- Support for compressed grid files to reduce distribution sizes

1.20.3 5.7.0 - 2024-01-27

Changed

- Updates to data for Canada, Denmark, France, Germany and USA
- More aggressive buffering of extent polygons

1.20.4 5.6.0 - 2023-09-30

Changed

- Updates to data for Australia, Austria, Canada, Germany, Italy, Netherlands, Portugal, South Korea, UK and USA

1.20.5 5.5.0 - 2023-07-07

Added

- Support for Lambert Cylindrical Equal Area (Spherical) projection

Changed

- Infer a current epoch when doing time-dependant transforms and no explicit epoch is supplied
- Updates to data for Polar regions, Algeria and Spain

Deprecated

- The namespace of all `*Point` classes have been tidied up and changed to from `PHPCoord` to `PHPCoord\Point` e.g. `PHPCoord\GeographicPoint` is now `PHPCoord\Point\GeographicPoint`. An alias has been provided, all existing code referencing the old names will continue to work

1.20.6 5.4.0 - 2023-05-27

Added

- Added `getSupportedSRIDsWithHelp()` as a version of `getSupportedSRIDs()` that returns at runtime the inline help available within the source code

Changed

- Updates to data for Algeria, Bosnia and Herzegovina, Denmark, Germany, Latvia and USA

1.20.7 5.3.1 - 2023-02-20

Changed

- Further enhancements to coordinate conversion from a `CompoundPoint`

1.20.8 5.3.0 - 2023-02-19

Added

- Support for converting coordinates from a `CompoundPoint` where the horizontal component is `Projected` to a 3D CRS

Changed

- Updates to data for ETRS89, Colombia, Slovenia, USA and UK

Fixed

- Don't use 2D CRS as intermediate in a chain when converting from/to a 3D CRS

1.20.9 5.2.0 - 2023-01-08

Changed

- Updates to data for IGS, Japan and UK

Fixed

- Improved handling of extent polygon buffering involving complex shapes (e.g. Netherlands)
- Fixed longitude wraparound issue with GTX grids

1.20.10 5.1.0 - 2022-11-10

Added

- Support for 3D projected coordinates
- Support for custom coordinate reference systems and custom conversions

Changed

- Updates to data for ITRF, WGS84, Australia, Belgium, Canada, France, Germany, Iceland, Indonesia, Ireland, Japan, Luxembourg, Norway, North Macedonia, UK and USA
- Some internal simplifications and optimisations

Fixed

- Improved handling of longitudes greater than 180 degrees
- Corrected conversion of geocentric coordinates to geographic coordinates when using a non-Greenwich prime meridian

1.20.11 5.0.1 - 2022-01-29

Fixed

- Guard against divide by zero issues when calculating distance between two points

1.20.12 5.0.0 - 2021-11-12

Added

- Support for IGN France geocentric translation by grid interpolation. This requires the Europe datapack
- Support for vertical grid files. These require a relevant datapack

Changed

- The signatures of all `*Point::create*()` methods have been changed to put the CRS *first*. Previously the distance/direction values came first. This is to ensure that all optional parameters are at the end of the signature, addressing a PHP8.1 deprecation.

  Example:

```
// in v4
GeographicPoint::create(
    Angle $latitude,
    Angle $longitude,
    ?Length $height = null,
    Geographic $crs, // was after distance/direction
    ?DateTimeInterface $epoch = null
): GeographicPoint

// in v5
GeographicPoint::create(
    Geographic $crs, // now goes first
    Angle $latitude,
    Angle $longitude,
    ?Length $height = null,
    ?DateTimeInterface $epoch = null
): GeographicPoint
```

- Updates to data for Canada, Norway, UK
- Some internal simplifications and optimisations
- Supported PHP versions changed to `^8.0`

1.20.13 4.7.1 - 2024-01-26

The v4.x series is receiving basic maintenance only. All feature development takes place in v5.x. This is because one of PHP8.1's new deprecations required a significant non-backwards compatible change to address.

Fixed

- Buffering of Irish extent

1.20.14 4.7.0 - 2022-06-26

Added

- Support for defining 3D projected coordinates

Fixed

- Improved handling of longitudes greater than 180 degrees
- Corrected conversion of geocentric coordinates to geographic coordinates when using a non-Greenwich prime meridian

Changed

- Updates to data for ITRF, WGS84, Australia, Belgium, Canada, France, Germany, Iceland, Ireland, Japan, Luxembourg, Norway, North Macedonia, UK and USA

1.20.15 4.6.1 - 2022-01-29

Fixed

- Guard against divide by zero issues when calculating distance between two points

1.20.16 4.6.0 - 2021-10-22

Changed

- Updates to data for Papua New Guinea, Ukraine and WGS84
- Some internal simplifications and optimisations

Fixed

- Corrected the decoding of sexagesimal DMS degree fractional components

1.20.17 4.5.0 - 2021-09-25

Changed

- Updates to data for Canada, Costa Rica, France, French Southern Territories, Kyrgistan, Liechtenstein, Poland, Russia, Switzerland, Tonga, UK, USA, Wallis and Futuna
- Many internal simplifications and optimisations, leading to faster conversions and a corresponding update of the maximum chain depth from 5 to 7

Fixed

- *Some* PHP8.1 deprecations

Deprecated

- `Compound::EPSG_RGF93_LAMBERT_93_PLUS_NGF_IGN69_HEIGHT`, use `Compound::EPSG_RGF93_V1_LAMBERT_93_PLUS_NG` instead
- `Compound::EPSG_RGF93_LAMBERT_93_PLUS_NGF_IGN78_HEIGHT`, use `Compound::EPSG_RGF93_V1_LAMBERT_93_PLUS_NG` instead
- `Compound::EPSG_RGF93_PLUS_NGF_IGN69_HEIGHT`, use `Compound::EPSG_RGF93_V2_PLUS_NGF_IGN69_HEIGHT` instead
- `Compound::EPSG_RGF93_PLUS_NGF_IGN78_HEIGHT`, use `Compound::EPSG_RGF93_V2_PLUS_NGF_IGN78_HEIGHT` instead
- `Geocentric::EPSG_CHTRF95`, use `Geocentric::EPSG_CHTRS95` instead
- `Geocentric::EPSG_RGF93`, use `Geocentric::EPSG_RGF93_V1` instead
- `Geographic2D::EPSG_CHTRF95`, use `Geographic2D::EPSG_CHTRS95` instead
- `Geographic2D::EPSG_RGF93`, use `Geographic2D::EPSG_RGF93_V1` instead
- `Geographic2D::EPSG_RGF93_LON_LAT`, use `Geographic2D::EPSG_RGF93_V1_LON_LAT` instead
- `Geographic3D::EPSG_CHTRF95`, use `Geographic3D::EPSG_CHTRS95` instead
- `Geographic3D::EPSG_RGF93`, use `Geographic3D::EPSG_RGF93_V1` instead
- `Geographic3D::EPSG_RGF93_LON_LAT`, use `Geographic3D::EPSG_RGF93_V1_LON_LAT` instead
- `Projected::EPSG_RGF93_CC42`, use `Projected::EPSG_RGF93_V1_CC42` instead
- `Projected::EPSG_RGF93_CC43`, use `Projected::EPSG_RGF93_V1_CC43` instead
- `Projected::EPSG_RGF93_CC44`, use `Projected::EPSG_RGF93_V1_CC44` instead
- `Projected::EPSG_RGF93_CC45`, use `Projected::EPSG_RGF93_V1_CC45` instead
- `Projected::EPSG_RGF93_CC46`, use `Projected::EPSG_RGF93_V1_CC46` instead
- `Projected::EPSG_RGF93_CC47`, use `Projected::EPSG_RGF93_V1_CC47` instead
- `Projected::EPSG_RGF93_CC48`, use `Projected::EPSG_RGF93_V1_CC48` instead
- `Projected::EPSG_RGF93_CC49`, use `Projected::EPSG_RGF93_V1_CC49` instead
- `Projected::EPSG_RGF93_CC50`, use `Projected::EPSG_RGF93_V1_CC50` instead
- `Projected::EPSG_RGF93_LAMBERT_93`, use `Projected::EPSG_RGF93_V1_LAMBERT_93` instead

- `Datum::EPSG_SWISS_TERRESTRIAL_REFERENCE_FRAME_1995`, use `Datum::EPSG_SWISS_TERRESTRIAL_REFERENCE_SYSTE` instead
- `Datum::EPSG_RESEAU_GEODESIQUE_FRANCAIS_1993`, use `Datum::EPSG_RESEAU_GEODESIQUE_FRANCAIS_1993_V1` instead

1.20.18 4.4.0 - 2021-06-24

Added

- Support for NTv2, OSTN15/OSGM15 and NADCON5 grid files. These require a relevant datapack

Changed

- Updates to data for Argentina, Belgium, Canada, Costa Rica, Czechia, Greenland, Italy, Russia, UK and USA
- Performance optimisations
- Supported PHP versions changed to `^7.4||^8.0`

Deprecated

- `Compound::EPSG_BELGE_1972_BELGIAN_LAMBERT_72_PLUS_OSTEND_HEIGHT`, use `Compound::EPSG_BD72_BELGIAN_LAMBERT_72_PLUS_OSTEND_HEIGHT` instead
- `Geographic2D::EPSG_BELGE_1950`, use `Geographic2D::EPSG_BD50` instead
- `Geographic2D::EPSG_BELGE_1950_BRUSSELS`, use `Geographic2D::EPSG_BD50_BRUSSELS` instead
- `Geographic2D::EPSG_BELGE_1972`, use `Geographic2D::EPSG_BD72` instead
- `Projected::EPSG_BELGE_1950_BRUSSELS_BELGE_LAMBERT_50`, use `Projected::EPSG_BD50_BRUSSELS_BELGE_LAMBERT` instead
- `Projected::EPSG_BELGE_1972_BELGE_LAMBERT_72`, use `Projected::EPSG_BD72_BELGE_LAMBERT_72` instead
- `Projected::EPSG_BELGE_1972_BELGIAN_LAMBERT_72`, use `Projected::EPSG_BD72_BELGIAN_LAMBERT_72` instead
- `Vertical::EPSG_GENOA_HEIGHT`, use `Vertical::EPSG_GENOA_1942_HEIGHT` instead
- `Datum::EPSG_GENOA`, use `Datum::EPSG_GENOA_1942` instead

1.20.19 4.3.0 - 2021-04-24

Added

- Datapacks. See docs for more info

Changed

- Updates to data for Canada

1.20.20 4.2.0 - 2021-04-19

Added

- More accurate extent data

Fixed

- Ensure projections still work even when origin points are on the other side of the antimeridian

Changed

- Updates to data for Australia, Poland, UK and US Gulf of Mexico

Deprecated

- `Compound::EPSG_OSGB_1936_BRITISH_NATIONAL_GRID_PLUS_ODN_HEIGHT`, use `Compound::EPSG_OSGB36_BRITISH_NATIONAL_GRID_PLUS_ODN_HEIGHT` instead
- `Geographic2D::EPSG_OSGB_1936`, use `Geographic2D::EPSG_OSGB36` instead
- `Projected::EPSG_OSGB_1936_BRITISH_NATIONAL_GRID`, use `Projected::EPSG_OSGB36_BRITISH_NATIONAL_GRID` instead
- `Projected::EPSG_ETRS89_POLAND_CS2000_ZONE_5`, use `Projected::EPSG_ETRF2000_PL_CS2000_15` instead
- `Projected::EPSG_ETRS89_POLAND_CS2000_ZONE_6`, use `Projected::EPSG_ETRF2000_PL_CS2000_18` instead
- `Projected::EPSG_ETRS89_POLAND_CS2000_ZONE_7`, use `Projected::EPSG_ETRF2000_PL_CS2000_21` instead
- `Projected::EPSG_ETRS89_POLAND_CS2000_ZONE_8`, use `Projected::EPSG_ETRF2000_PL_CS2000_24` instead
- `Projected::EPSG_ETRS89_POLAND_CS92`, use `Projected::EPSG_ETRF2000_PL_CS92` instead
- `Datum::EPSG_OSGB_1936`, use `Datum::EPSG_ORDNANCE_SURVEY_OF_GREAT_BRITAIN_1936` instead

1.20.21 4.1.0 - 2021-03-03

Added

- Added `UTMPoint` as a better way of handling UTM zones than the EPSG model does it
  - Improved conversion chaining for `CompoundPoints`

Changed

- Moved `verticalOffsetAndSlope` method from `CompoundPoint` to `VerticalPoint`. This is technically a breaking change, but since the code is only 2 days old shouldn't affect anyone.

1.20.22 4.0.1 - 2021-03-01

Fixed

- Documentation issues

1.20.23 4.0.0 - 2021-03-01

Added

- Chaining of conversions
- Documentation(!)

1.20.24 4.0.0beta1 - 2021-01-05

Added

- 6200+ new coordinate systems.

Changed

- Project reimplemented from scratch. License changed from GPL to MIT.

1.20.25 3.1.2 - 2020-09-29

Changed

- Supported PHP versions changed from `^7.1` to `^7.3||^8.0`

1.20.26 3.1.1 - 2020-04-16

Fixed

- Corrected an issue with transforming ITM references to WGS84
- Corrected an issue with transforming Irish Grid references to WGS84

1.20.27 3.1.0 - 2019-07-21

Added

- Added `OSRef::toGridReferenceWithSpaces` to complement `OSRef::toGridReference` [thomasedwards]

1.20.28 3.0.0 - 2019-04-13

Added

- Support for *accepting* 2, 4, 8 and 10 figure Ordnance Survey references (6 figure was already supported)

Changed

- fromSixFigureReference
- All value objects are now immutable - calling a conversion function on them now returns a *new* object rather than modifying the existing one
- Minimum PHP version is now 7.1

Removed

- HHVM support now that project has a stated goal of no longer targeting PHP7 compatibility
- `OSRef::fromSixFigureReference()` has been removed, use `OSRef::fromGridReference()` instead
- `OSRef::to[Two/Four/Six/Eight/Ten]FigureReference()` have been removed, use `OSRef::toGridReference($length)` instead

1.20.29 2.1 - 2016-09-20

Added

- Added distance calculations for grid-based co-ordinate systems to complement the existing lat/long implementation

1.20.30 2.0.3 - 2016-05-29

Fixed

- Fixed confusing docblock

1.20.31 2.0.2 - 2016-01-31

Fixed

- Ensure consistency of units

1.20.32 2.0.1 - 2016-01-19

Added

- Add support for 2, 4, 8 and 10 figure Ordnance Survey references (6 figure was already supported) [stevegoddard]

1.20.33 2.0 - 2016-01-03

Added

- 3D co-ordinates
- Irish Grid and ITM support

Changed

- Major refactoring, breaks compatibility with previous API (hopefully for the better!)

1.20.34 1.1.2 - 2015-12-31

Fixed

- Corrected issue with Helmert transform where the resulting co-ordinate could be placed into the wrong quadrant

1.20.35 1.1.1 - 2014-11-19

Fixed

- Corrected bug in original code where OS 6-figure grid references were sometimes off by 1

Changed

- Updated Composer to use PSR-4

1.20.36 1.1 - 2013-08-01

Just cleanup

1.20.37 1.0.0 - 2013-02-13

Initial release of this fork (based off of v2.3 of original)

Fixed

- When converting Latitude and Longitude between WGS84 and OSGB36 or vice-versa, a wrong constant for the y translation has been corrected (was off by 1 metre)

Changed

- Eastings and northings are rounded to 1m, and lat/long to 5dp (approx 1m) to avoid any misconceptions that precision is the same thing as accuracy.
- When calculating surface distances, a more accurate mean radius is now used rather than that derived from historical definitions of a nautical mile
